

Best sandwich plate adapter for oil system?

Posted by Skimr2 - 24 Jun 2008 06:28

Like it says above, who makes a good sandwich adapter plate to fit an external oil cooler? Thanks in advance for advice. Also, do our cars typically use the -12 an size fittings? What size oil cooler should I get if I want to install behind the foglight hole passenger side?

Thanks for any advice. Yes I did read the oil cooler thread below, and yes, I probably could have posted this question there.

Well I got a deal on the 951 System, and I can always down the road upgrade the cooler element if this doesn't provide enough heat dissipation, but I think it will do the trick nicely. I plan on flushing it out thoroughly before I install it. I would really like to find the shroud that forces air right through the cooler like I saw in the catalog.

New gasket and o-rings are in the mail. Maybe I will take some pics and do a write up if I remember when I go to install it.

You will need to fab a shroud. Since the cooler must be mounted differently from the 951 installation (remember the 951 nose is different) I don't believe that shroud will work. Still ducting is pretty easy to fab up.
